# Problem Statement

## 13.5 Q12 [NCERT 12]

Find the probability of throwing at most 2 sixes in 6 throws of a single die.

# Random Variable Definition

In this experiment, there are six consecutive Bernoulli trials. Let us define a Binomial Random Variable  $X = \{0, 1, 2, 3, 4, 5, 6\}$  where the value of  $X$  is the number of sixes obtained

# Probability Mass Function

The probability of success (assuming a fair die) is  $p = \frac{1}{6}$ .  
Therefore, the probability that  $X$  maps to  $i$  is given by:

$$\Pr(X = i) = \binom{6}{i} (1 - p)^{6-i} p^i, \quad 0 \leq i \leq 6 \quad (1)$$

The values for  $i$  can be substituted in the above formula, and the graph of the PMF can be obtained.

# Cumulative Distribution Function

The cumulative probability  $\Pr(X \leq i)$  can be defined as under:

$$\Pr(X \leq i) = \sum_{k=0}^i \binom{6}{k} (1-p)^{6-k} p^k, \quad 0 \leq i \leq 6 \quad (2)$$

The values of  $i$  can be substituted in the above equation, and the obtained values can be used to plot the CDF graph.

# Solution

The probability to be found corresponds to the case  $\Pr(X \leq 2)$ .  
Substituting  $i$  in Equation 1 and summing, we get

$$\Pr(X = 2) + \Pr(X = 1) + \Pr(X = 0) = \frac{5^4}{3^3 \times 2^6} \approx 0.36 \quad (3)$$

# PMF Graph

The PMF graph is:

Figure 0: Probability Mass Function

# CDF Graph

The CDF graph is:
